Abstract: In this pilot clinical study, we assessed the effects of positive end-expiratory pressure (PEEP) on tidal recruitment and overdistension in mechanically ventilated patients. Changes in EIT-derived regional respiratory system compliance ($C_{rs}$) induced by variation of tidal volume ($V_T$) were analysed in the chest cross-section and identified the simultaneous occurrence of tidal recruitment and overdistension in the examined patients.

1 Introduction

Tidal recruitment associated with cyclic opening and closing of alveoli and alveolar overdistension are important mechanisms in the genesis of ventilator-induced lung injury [1]. One promising method for detection of these phenomena is the calculation of regional $C_{rs}$ in individual image pixels [2] or as profiles in 32 horizontal chest layers [3].

When a patient is ventilated with two different values of $V_T$ and regional $C_{rs}$ is calculated in each setting, the differences in regional $C_{rs}$ induced by the $V_T$ variation can be determined. In the present paper, we used this approach to quantify the amount of tidal recruitment and overdistension by calculating the $V_T$-dependent changes in $C_{rs}$ at two PEEP values on a pixel-by-pixel basis.

2 Methods

We performed a retrospective analysis of data from five critically ill patients (4 male, 1 female, 74±6 years (mean age±SD)) with acute respiratory distress syndrome (ARDS). The patients were ventilated in a volume-controlled mode at two different PEEP values (PEEP$_{high}$, PEEP$_{low}$). As described in [2], PEEP$_{high}$ and PEEP$_{low}$ were set individually in each patient based on the analysis of a quasi-static pressure-volume manoeuvre. For the diagnosis of tidal recruitment and overdistension, a variation of $V_T$ between a high value of 10 ml/kg ideal body weight (IBW) and low value of 6 ml/kg IBW was performed at both PEEP values.

EIT measurements were carried out with the Goe-MF II device (CareFusion, Höchberg, Germany) using a set of 16 electrodes (L-00-S, Ambu, Ballerup, Denmark). EIT images were generated using the back-projection algorithm.

Regional $C_{rs}$ was calculated by dividing the individual pixel values of tidal amplitude of relative impedance change ($rel \Delta Z$) by the sum of all these values and by multiplying them with the global $C_{rs}$. The regional $C_{rs}$ values at low $V_T$ were subtracted from the respective values with high $V_T$ to generate difference images, visualising $\Delta C_{rs}$ between high and low $V_T$ in every pixel (Fig.1). For quantitative estimation of tidal recruitment and overdistension, we calculated the sum of pixels with positive values of $\Delta C_{rs}$ and divided the resulting value by the global $C_{rs}$ at high $V_T$. This analysis rendered a dimensionless index value of the amount of tidal recruitment that was finally multiplied by 100 to yield a value in %. This was performed similarly for all pixels with negative values of $\Delta C_{rs}$ to create an index value of alveolar overdistension.

3 Results

Tidal recruitment and alveolar overdistension occurred simultaneously at both PEEP levels in all studied patients. At PEEP$_{high}$, we found a non-significant reduction in tidal recruitment (11% vs 14%; p=n.s.) and a non-significant increase in overdistension (18% vs 11%; p=n.s.) in comparison with PEEP$_{low}$.

4 Conclusions

Analysis of changes in EIT-derived regional $C_{rs}$ between high and low $V_T$ is feasible in mechanically ventilated patients and may be used to quantify the overall amount of tidal recruitment and overdistension at a given PEEP. This might be used for an individualized optimization of PEEP and $V_T$ setting adapted to the regional respiratory system mechanics.

Figure 1: Map of regional differences in respiratory system compliance ($\Delta C_{rs}$) between high and low $V_T$ at the high positive end-expiratory pressure (PEEP$_{high}$) in one of the examined patients. Positive values imply tidal recruitment, whereas negative values show overdistension. At this PEEP level, 10% overdistension and 6% tidal recruitment were identified in this patient.
