For the circuit above:

- What is the Differential Gain, \( G_d = \frac{V_o}{(V_B - V_A)} \)?

- What is the Common-mode Gain, \( G_{cm} = \frac{V_o}{\left(\frac{1}{2}(V_B + V_A)\right)} \)?

- What is the Common-mode Rejection Ratio (CMRR)?

All op amps are ideal with \( V_{CC} = 15 \text{ V} \) and \( V_{CC} = -15 \text{ V} \).

\[ \begin{align*}
V_o &= \left(\frac{R_3 + R_4}{R_1 + R_2}\right) \left(\frac{R_3}{R_2}\right) V_B - \left(\frac{R_1}{R_2}\right) V_B \\
V_o &= \left(\frac{25 + 1.2}{25 + 1.201}\right) \left(-\frac{25}{1.201}\right) V_B - \left(-\frac{25}{1.201}\right) V_B = 20.8325 V_B - 20.8160 V_A
\end{align*} \]

Set \( V_B = -V_A = 1 \text{ V} \), \( V_d = V_B - V_A = 2 \text{ V} \).

\( G_d = \frac{V_o}{V_d} = \frac{20.8325(1) - 20.8160(-1)}{2} = 20.8242 \)

- What is the Common-mode Gain, \( G_{cm} = \frac{V_o}{\left(\frac{1}{2}(V_B + V_A)\right)} \)?

Set \( V_B = V_A = 1 \text{ V} \), \( V_{cm} = \frac{1}{2}(V_B + V_A) = 1 \text{ V} \).

\( G_{cm} = \frac{V_o}{V_d} = \frac{20.8325(1) - 20.8160(1)}{1} = 0.0165 \)

- What is the Common-mode Rejection Ratio (CMRR)?

\( \text{CMRR} = 20 \log_{10} \frac{20.8242}{0.0165} = 62.02 \)
For the circuit above:

- Sketch $V_o$ as a function of time.
- What is $V_x - V_y$ at $t = 45$ ms?

All op amps are ideal with $V_{CC} = 15$ V and $V_{CC} = -15$ V.

- Sketch $V_o$ as a function of time.

$$V_o = \left(1 + \frac{2R_A}{R_G}\right) \left(\frac{R_1}{R_2}\right) (V_B - V_A)$$

Thus:

<table>
<thead>
<tr>
<th>$t$ (ms)</th>
<th>$V_A$ (mV)</th>
<th>$V_B$ (mV)</th>
<th>$V_o$ (V) = 638.0$(V_B - V_A)$</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>2.1</td>
<td>4.1</td>
<td>1.276</td>
</tr>
<tr>
<td>15</td>
<td>2.4</td>
<td>4.1</td>
<td>1.085</td>
</tr>
<tr>
<td>25</td>
<td>2.1</td>
<td>4.1</td>
<td>1.276</td>
</tr>
<tr>
<td>35</td>
<td>2.1</td>
<td>6.3</td>
<td>2.680</td>
</tr>
<tr>
<td>45</td>
<td>2.1</td>
<td>4.1</td>
<td>1.276</td>
</tr>
</tbody>
</table>

- What is $V_x - V_y$ at $t = 45$ ms?

$$V_x - V_y = \left(1 + \frac{2R_A}{R_G}\right) (V_B - V_A)$$

$$V_x - V_y = 32.58 (V_B - V_A) = 32.58 (4.1 \text{ mV} - 2.1 \text{ mV}) = 0.065 \text{ V}$$
For the input, $V_i$, below, sketch the output, $V_o$, on the same graph. Indicate voltage levels and the times of any transitions. (The op amp is idea with the indicated $V_{CC}$ and $V_{EE}$ values).

Non-inverting amplifier:
Gain: $G = 1 + \frac{R_1}{R_2} = 1 + \frac{49}{2.2} = 23.27$

Ideally, output would swing from $-46.54$ V (at $t = 0$ ms) to $46.54$ V (at $t = 20$ ms).
However, output is limited to $\pm 10$ V.
Slope is $2 \times 46.54/20 = 2.327$ V/ms.
So starting at $V=0$, the limit of 10 V is reached in $\Delta t = 10 \text{ V} / 2.327 \text{ V/ms} = 4.297$ ms
