

Electrical Impedance Tomography: *recent advances in Image Reconstruction*

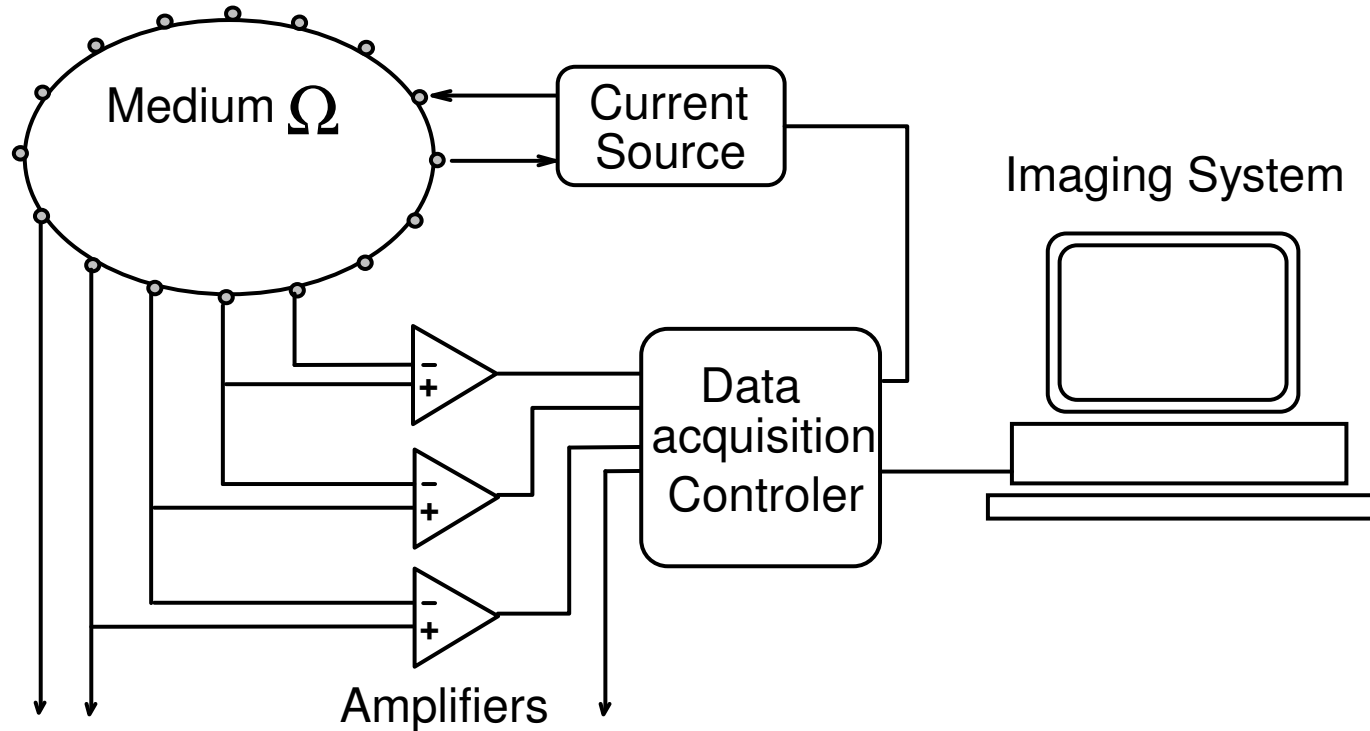

Andy Adler

Systems and Computer Engineering, Carleton U,
Ottawa, Canada

Outline

- Electrical Impedance Tomography
- Physics and Image Reconstruction
- Measurement Difficulties and solutions
 - Electrode Errors
 - Electrode Movement
 - Temporal Filtering
- EIDORS Project

Electrical Impedance Tomography: Block Diagram

EIT: Applications

EIT can image physiological processes involving movement of conductive fluids and gasses

- Lungs
- Heart / perfusion
- GI tract
- Brain
- Breast

EIT: Advantages

EIT is a relatively low resolution imaging modality, *but*

- Non-invasive
- Non-cumbersome
- Suitable for monitoring
- Underlying technology is low cost

Application: Breathing

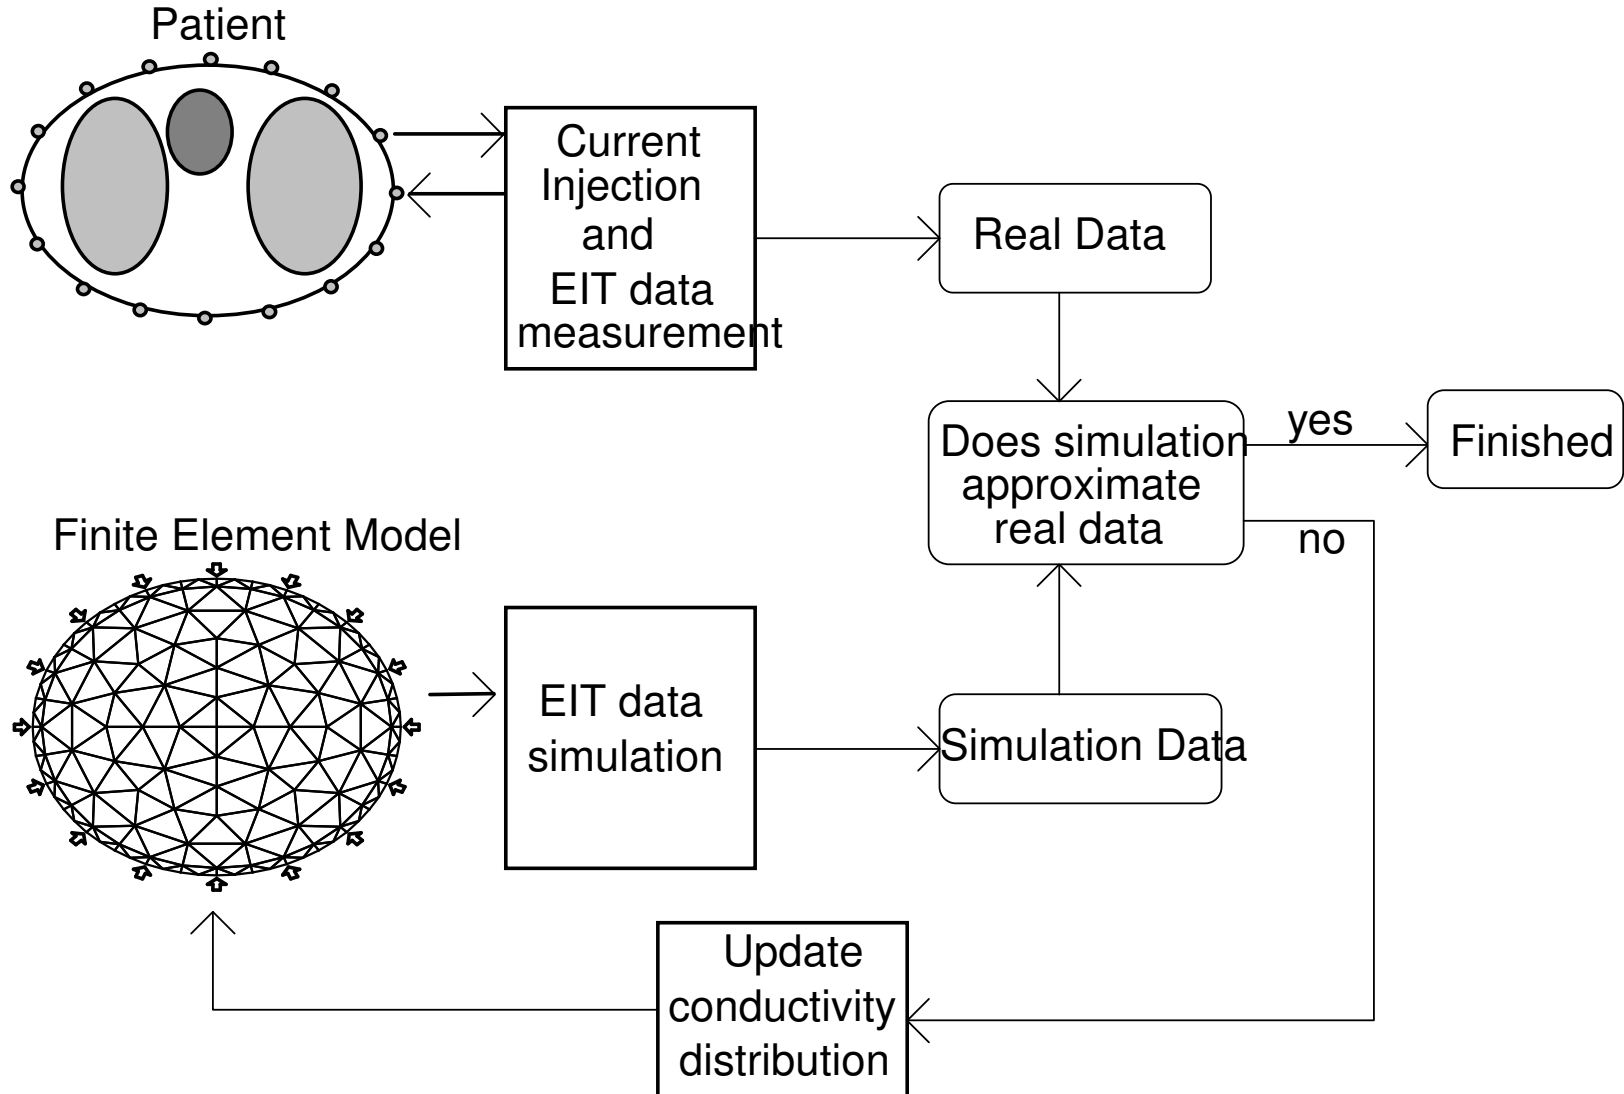

Chest images of tidal breathing in normal

Application: Heart Beat

EIT signal in ROI around heart and ECG

Iterative Image Reconstruction

Dynamic Imaging

- Calculate Δ conductivity
from Δ measurements
- Inverse problem *linearized*
- reduced sensitivity to electrode and hardware errors.
- Suitable for physiological imaging: lung, heart, GI

Image Reconstruction

- Forward Model (linearized)

System is underdetermined

Image Reconstruction

Regularized linear Inverse Model

Measurement Norm

Penalize measurements by the SNR of each channel (ie 1/noise variance)

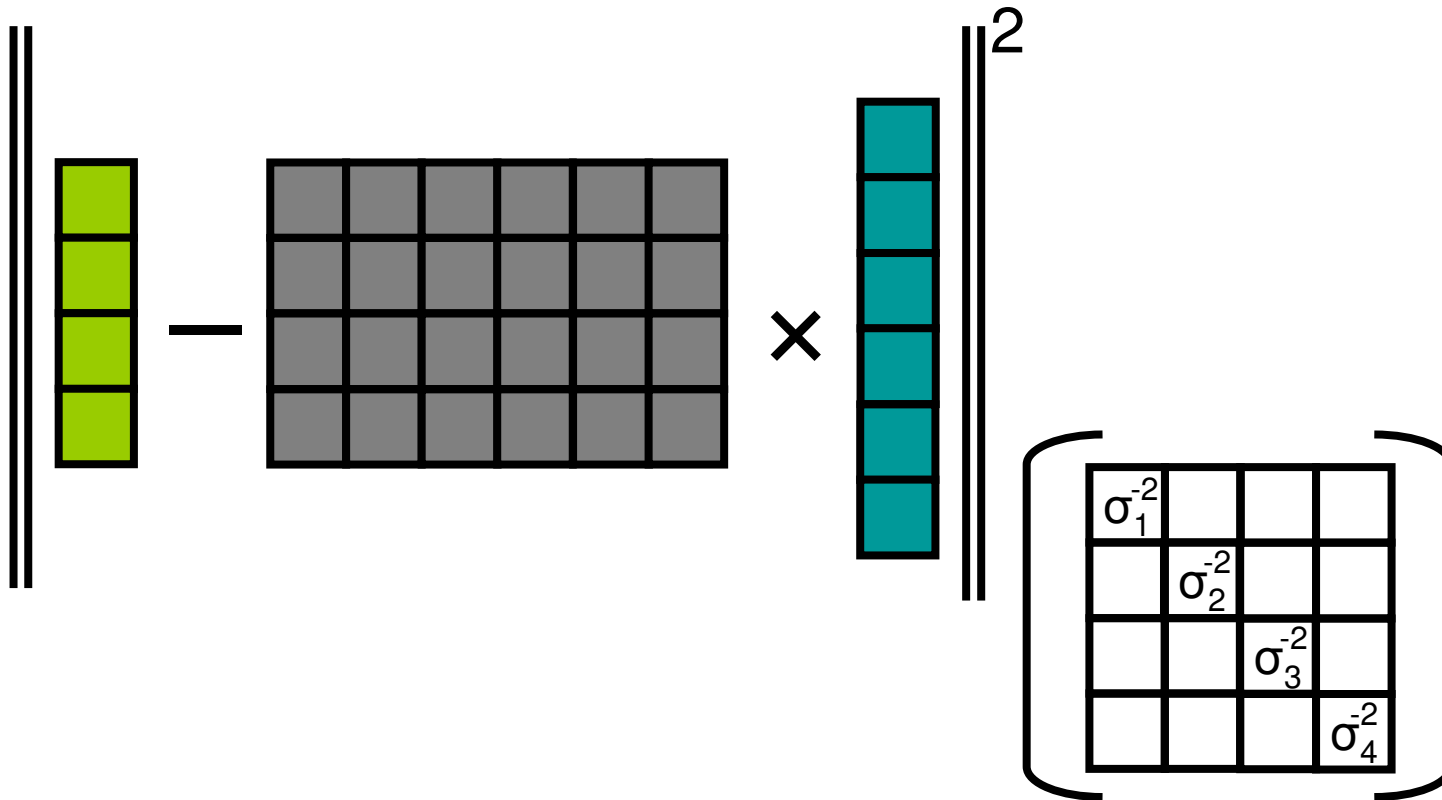

Image Reconstruction

Image Penalty Function

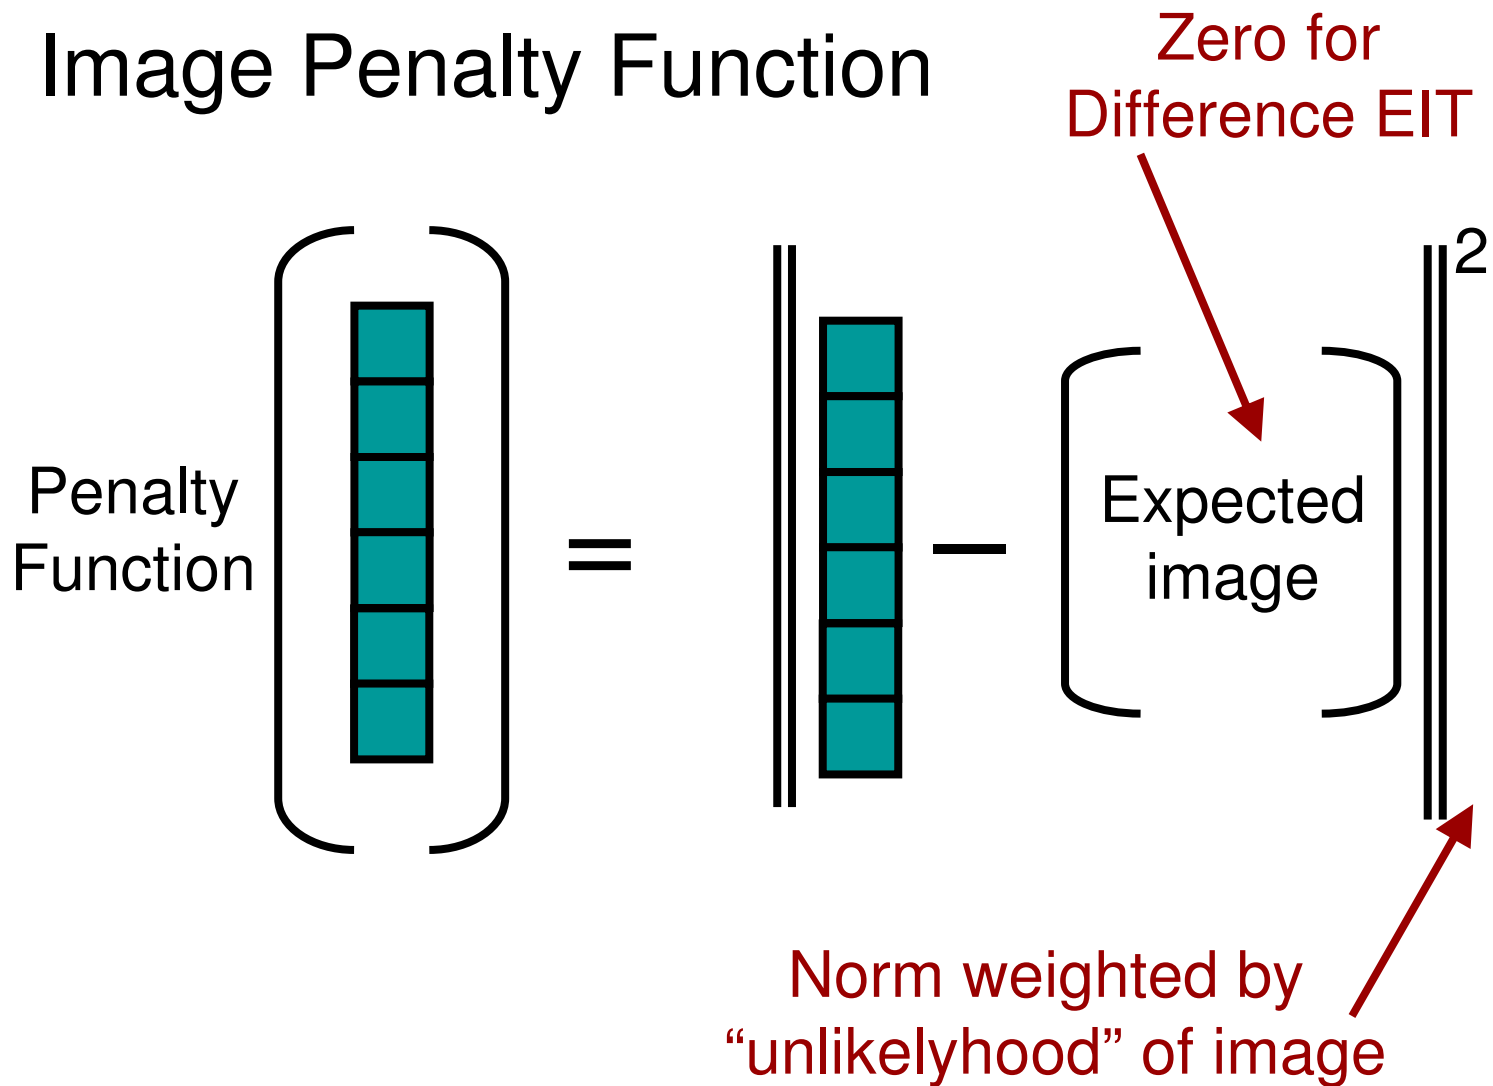

Image Reconstruction

- Penalty functions: Image Amplitude

Image Reconstruction

- Penalty functions: Image Smoothness

Applications ...

- Electrode Errors
- Electrode Movement
- Temporal Filtering

Electrode Measurement Errors

Experimental measurements with EIT quite often show large errors from one electrode

Causes aren't always clear

- Electrode Detaching
- Skin movement
- Sweat changes contact impedance
- Electronics Drift?

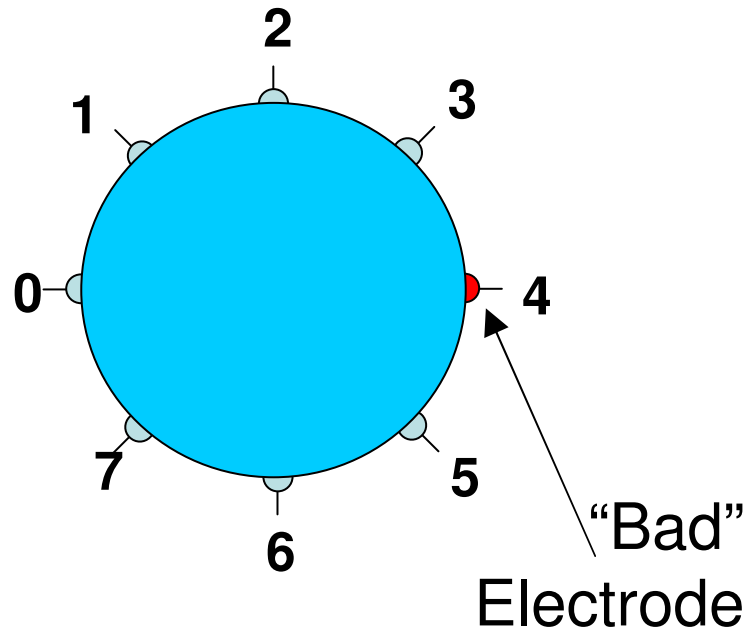

Example of electrode errors

Images measured in anaesthetised, ventilated dog

- A. Image of 700 ml ventilation
- B. Image of 100 ml saline instillation in right lung
- C. Image of 700 ml ventilation and 100 ml saline

Measurements with “bad” electrode

01	X	X		*	*			X
12	X	X	X	*	*			
23		X	X	X	*			
34	*	*	X	X	X	*	*	*
45	*	*	*	X	X	X	*	*
56				*	X	X	X	
67				*	*	X	X	X
70	X			*	*		X	X
	01	12	23	34	45	56	67	70

* “bad” measurement

X measurement at current injection

“Zero bad data” solution

“Traditional solution” (in the sense that I’ve done this)

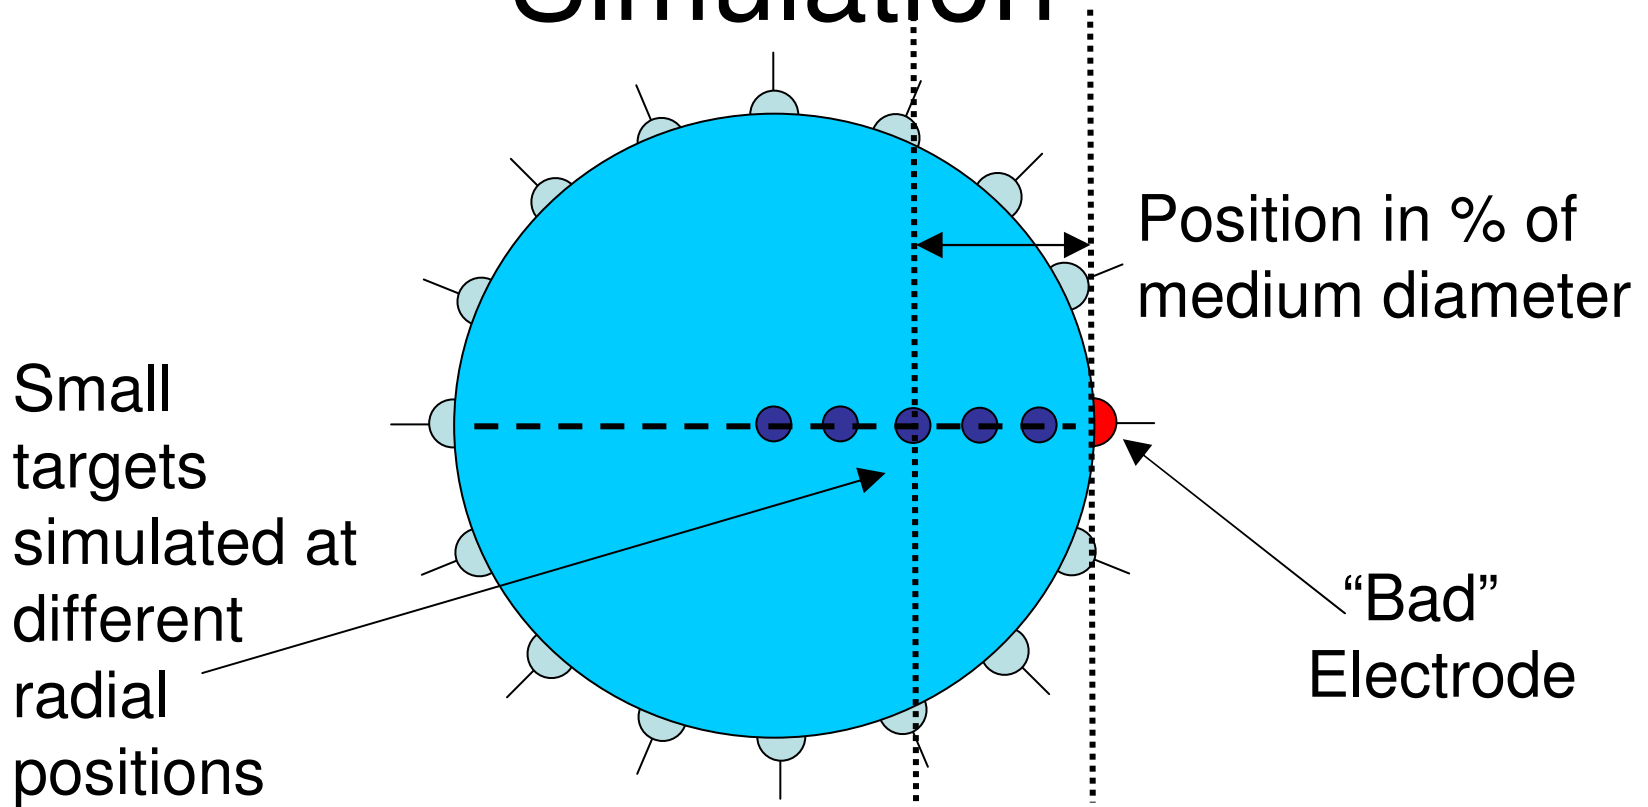

Regularized imaging solution

Electrode errors are **large measurement noise** on affected electrode

Simulation

Data simulated with 2D FEM with 1024 elements
– not same as inverse model

Simulation results for opposite drive

No Electrode Errors

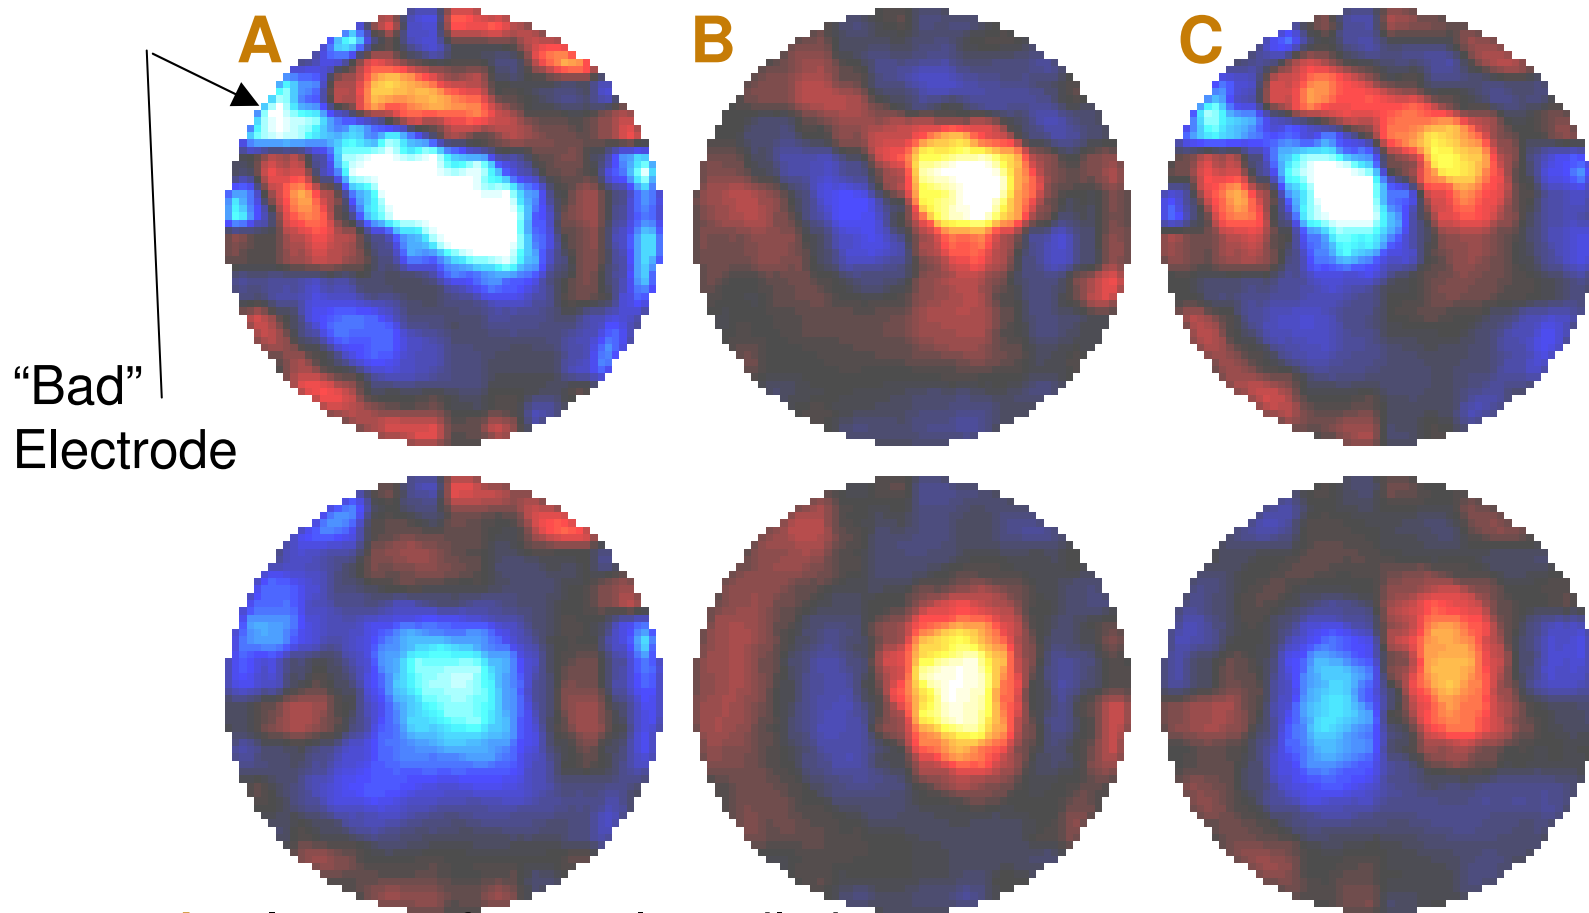

Zero Affected Measurements

Bayesian Inverse

How does this work with real data?

- A. Image of 700 ml ventilation
- B. Image of 100 ml saline instillation in right lung
- C. Image of 700 ml ventilation and 100 ml saline

Electrode Movement

Electrodes move

- with breathing
- with posture change

Simulations show broad
central artefact in
images

Imaging Electrode Movement

- Forward model *image* includes movement

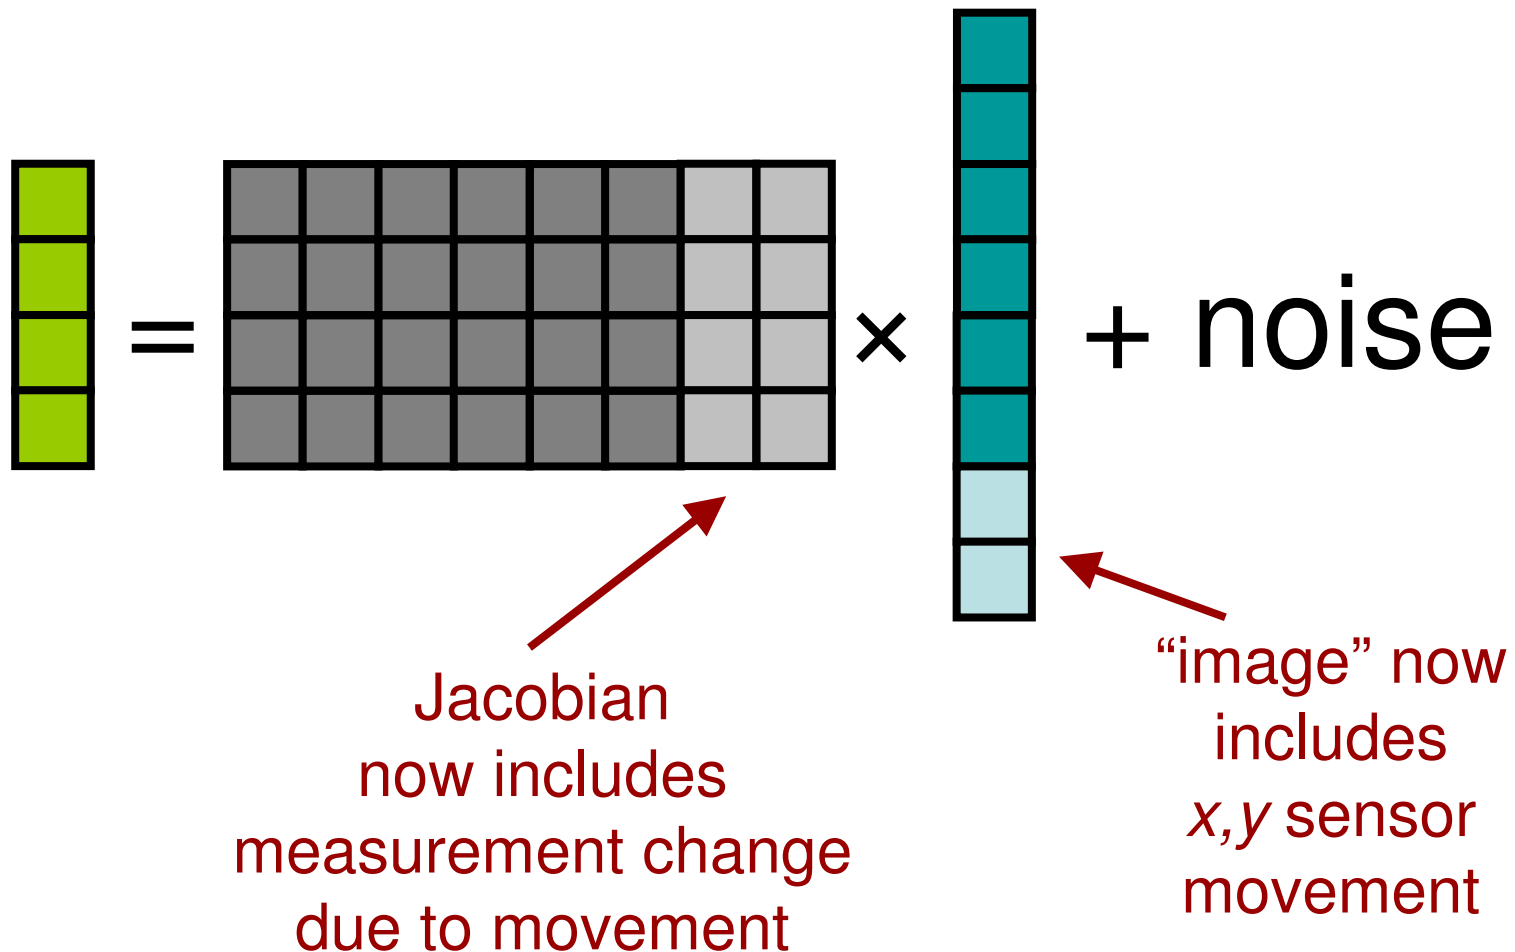

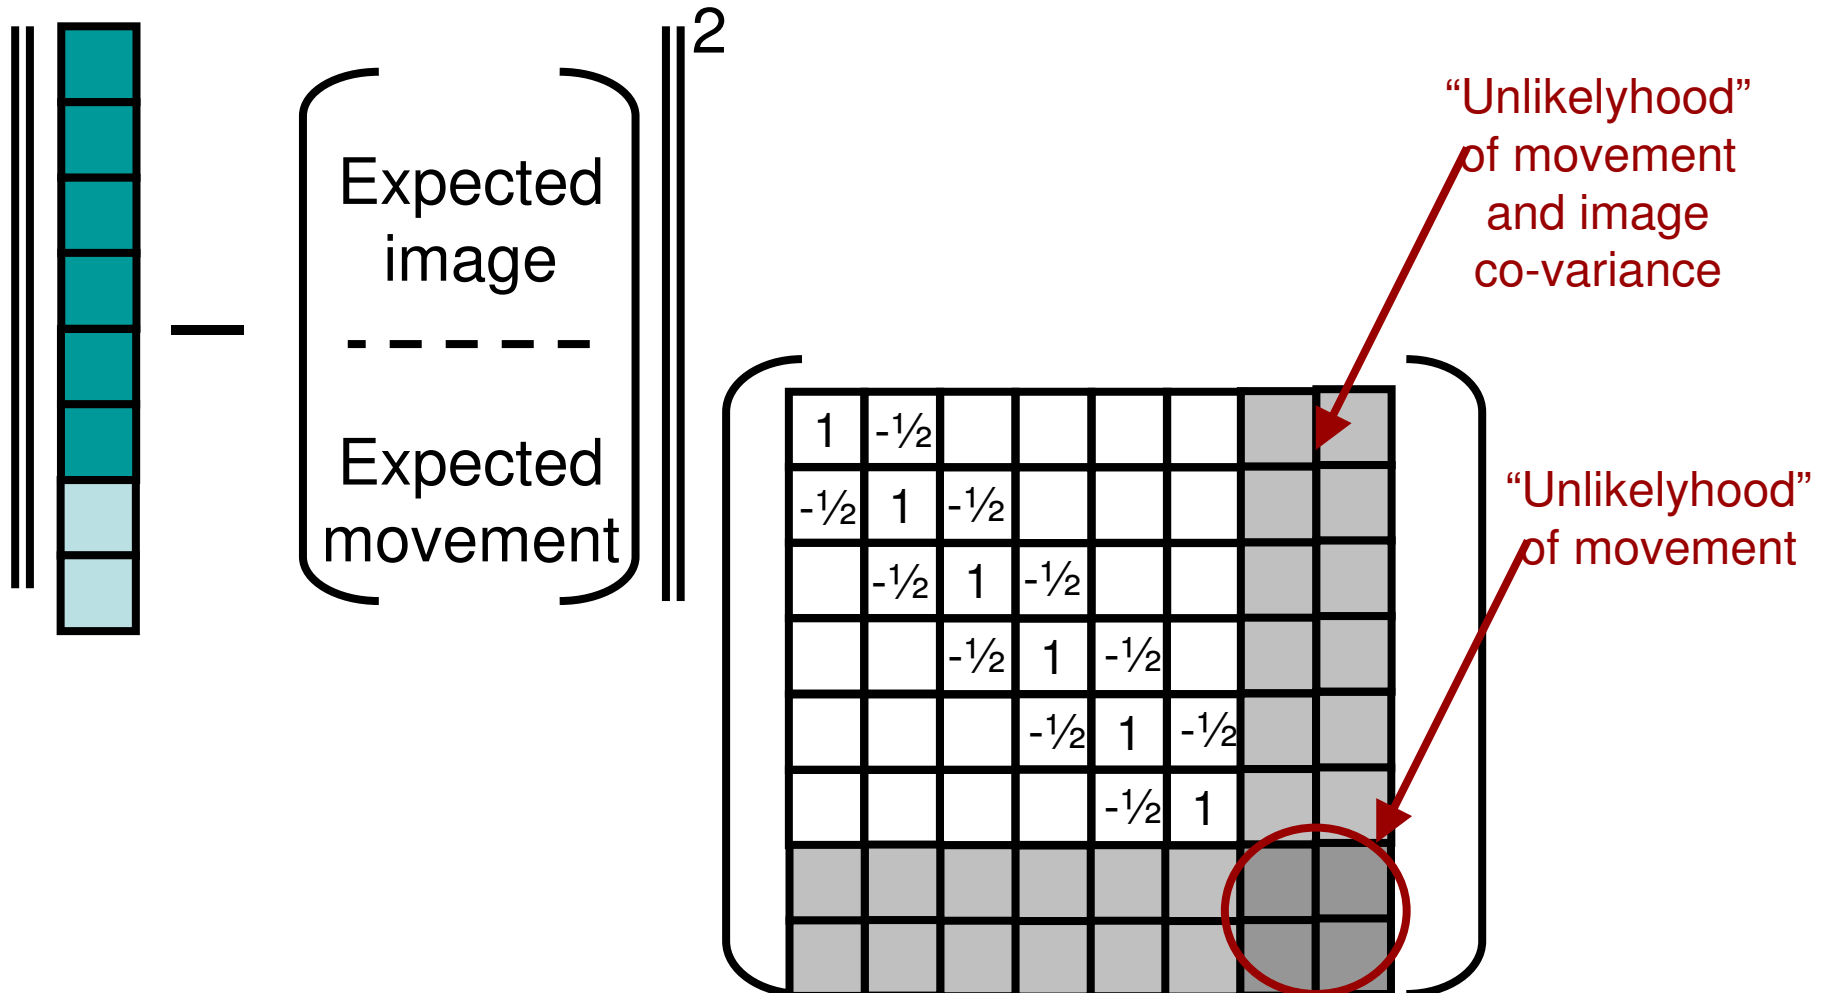

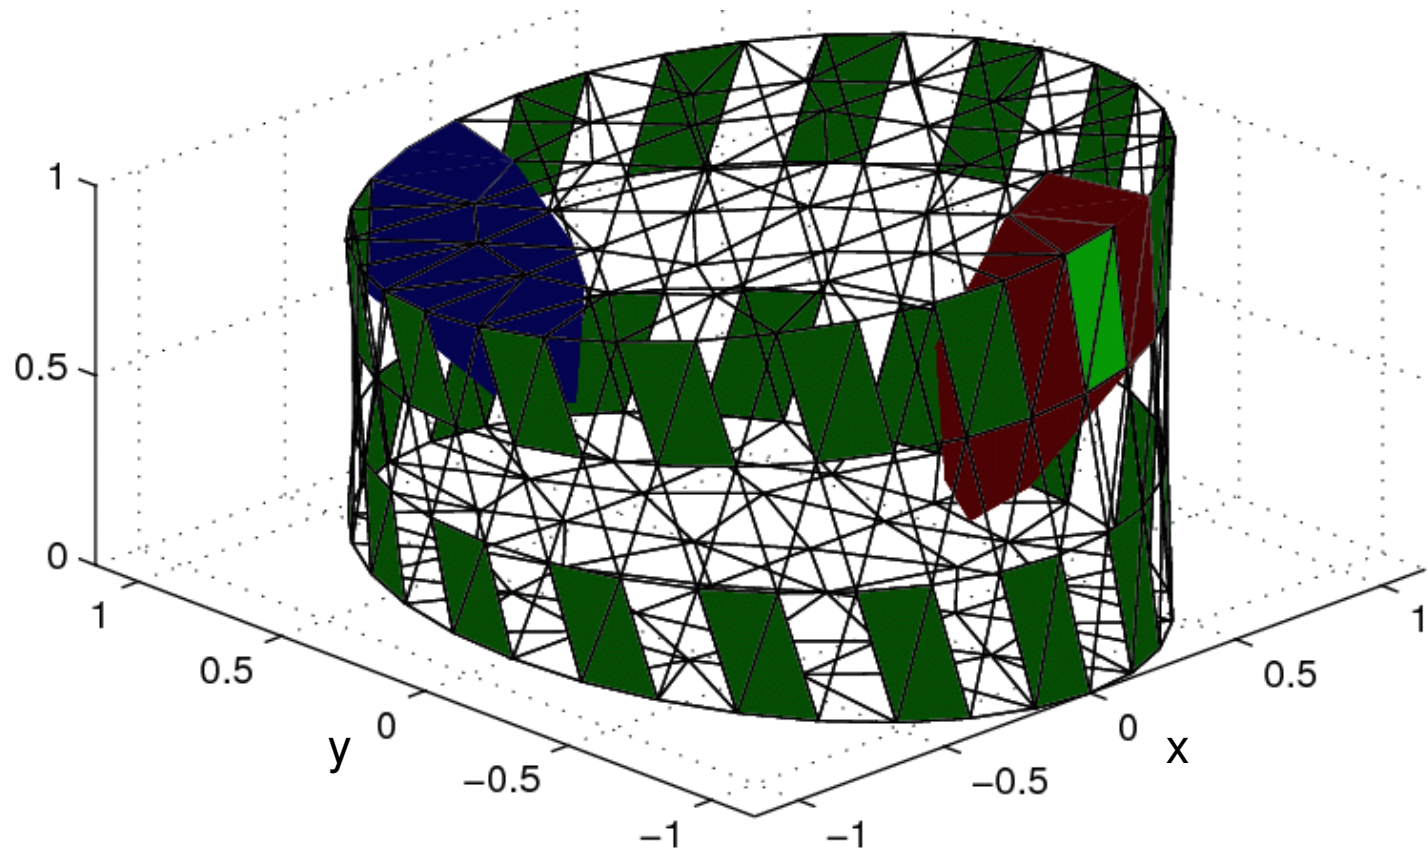

Image and movement

Penalty: Image and movement Smoothness

Images of electrode movement

Simulation: tank twisted in 3D

quite likely

1				1
1		1		1
1		1		1
	1	1	1	
	1		1	
	1		1	

unlikely

Standard EIT approaches do not take this into account

Kalman Filtering

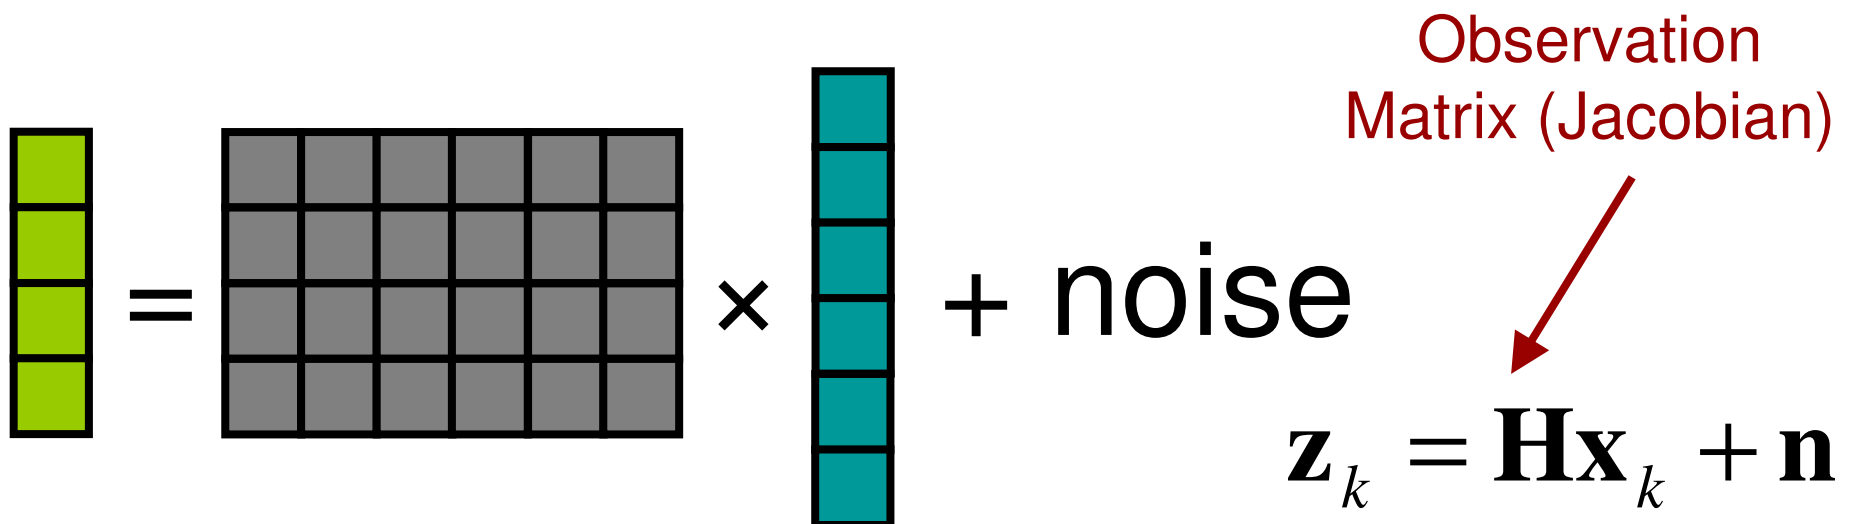

The diagram illustrates the state transition equation. On the left, a vertical column of six teal rectangles is labeled "now". This is followed by an equals sign, a 6x6 grid, a multiplication sign, another vertical column of six teal rectangles labeled "prev. step", and a plus sign followed by the word "process". To the right, the equation $\mathbf{x}_k = \mathbf{A}\mathbf{x}_{k-1} + \mathbf{w}$ is shown. A red arrow points from the text "State transition Matrix" to the matrix \mathbf{A} in the equation.

now = \times prev. step + process

State transition Matrix

$$\mathbf{x}_k = \mathbf{A}\mathbf{x}_{k-1} + \mathbf{w}$$

The diagram illustrates the observation equation. On the left, a vertical column of four light green rectangles is followed by an equals sign, a 4x6 grid with a gray background, a multiplication sign, a vertical column of six teal rectangles, and a plus sign followed by the word "noise". To the right, the equation $\mathbf{z}_k = \mathbf{H}\mathbf{x}_k + \mathbf{n}$ is shown. A red arrow points from the text "Observation Matrix (Jacobian)" to the matrix \mathbf{H} in the equation.

Observation Matrix (Jacobian)

$$\mathbf{z}_k = \mathbf{H}\mathbf{x}_k + \mathbf{n}$$

Kalman Filtering

Two stage process

- Prediction:
- Estimate of now based on old data only

$$\mathbf{x}_k^- = \mathbf{A}\mathbf{x}_{k-1}$$

- Update:

$$\hat{\mathbf{x}}_k = \mathbf{x}_k^- + \mathbf{K}_k (\mathbf{z}_k - \mathbf{H}\mathbf{x}_k^-)$$

- \mathbf{K} is *Kalman gain*:

– Need to update at each step

– Depends on $\mathbf{P}_k = \text{cov}(\hat{\mathbf{x}}_k - \mathbf{x}_k)$

Reconstructed Movies

- Algorithm is regularized one-step Gauss-Newton using Laplace prior

Netgen simulation of
moving ball,
Using 100,000 elements
per frame

Total simulation time =
3 days

Measurements of
moving plexiglas rod
in saline tank
(thanks to IIRC)

Total model time =
60 seconds

Gauss-Newton vs. Kalman

Data with added 0dB SNR noise

Gauss-Newton solver

Solve time = 5.33 s
(with caching) = 0.22 s

Kalman solver

Solve time = 29.6 min

Gauss-Newton vs. Kalman (0dB SNR)

Gauss-Newton solver

Solve time = 5.33 s
(with caching) = 0.22 s

Kalman solver

Solve time = 29.6 min

We need a faster solver

We can improve on Kalman in two ways

- We can go faster.
 - Kalman calculates the temporal prior. We can directly tell the algorithm
- Use *future* and *past* data
 - Most EIT reconstruction is post-processing
 - For online images, we can delay by a few frames ($\approx 100\text{ms}$)

Direct temporal solver

Rewrite as ...

Direct temporal forward model

Direct temporal inverse model

Temporal Priors

Spatial Prior	Time Prior $\Delta t = 1$	Time Prior $\Delta t = 2$	Time Prior $\Delta t = 3$	Time Prior $\Delta t = 4$
Time Prior $\Delta t = 1$	Spatial Prior	Time Prior $\Delta t = 1$	Time Prior $\Delta t = 2$	Time Prior $\Delta t = 3$
Time Prior $\Delta t = 2$	Time Prior $\Delta t = 1$	Spatial Prior	Time Prior $\Delta t = 1$	Time Prior $\Delta t = 2$
Time Prior $\Delta t = 3$	Time Prior $\Delta t = 2$	Time Prior $\Delta t = 1$	Spatial Prior	Time Prior $\Delta t = 1$
Time Prior $\Delta t = 4$	Time Prior $\Delta t = 3$	Time Prior $\Delta t = 2$	Time Prior $\Delta t = 1$	Spatial Prior

One-step inverse

We formulate the one step inverse as:

$$\|\mathbf{z} - \mathbf{H}\mathbf{x}\|_{\mathbf{W}}^2 + \lambda^2 \|\mathbf{x}\|_{\mathbf{R}}^2$$
$$\hat{\mathbf{x}} = \left(\mathbf{H}^t \mathbf{W} \mathbf{H} + \lambda^2 \mathbf{R} \right)^{-1} \mathbf{H}^t \mathbf{W} \mathbf{z}$$

Need to cut matrix afterward, we only want to estimate current image from data

Problem is size of matrix inverse:

For 2 time steps, we have 5 x num_elems square

Underdetermined formulation

We formulate the one step inverse as:

$$\hat{\mathbf{x}} = \left(\mathbf{H}^t \mathbf{W} \mathbf{H} + \lambda^2 \mathbf{R} \right)^{-1} \mathbf{H}^t \mathbf{W} \mathbf{z}$$

$$\hat{\mathbf{x}} = \mathbf{R}^{-1} \mathbf{H}^t \left(\mathbf{H} \mathbf{R}^{-1} \mathbf{H}^t + \lambda^2 \mathbf{W}^{-1} \right)^{-1} \mathbf{z}$$

Now matrix inverse is smaller:

For 2 time steps, we have 5 x num_meas square

\mathbf{R}^{-1} and \mathbf{W}^{-1} are modelled directly. No need to take the inverse

GN vs. Temporal Inverse

1. Noise free data (IIRC tank)
2. Data with added 6dB SNR noise

Gauss-Newton solver

Solve time = 5.33 s
(with caching) = 0.22 s

Temporal solver
(4 time steps)

Solve time = 34.81 s
(with caching) = 0.60 s

Gauss Newton vs. Temporal Inverse (6db SNR)

Gauss-Newton solver

Solve time = 5.33 s
(with caching) = 0.22 s

Temporal solver
(4 time steps)

Solve time = 34.81 s
(with caching) = 0.60 s

EIDORS: community-based extensible software for EIT

Andy Adler¹, William R.B. Lionheart²

Manchester, U.K.

EIDORS Tutorial

- Introduction to EIDORS
 - Goal
 - Features
- Examples (worked together)
 - Forward solutions
 - Inverse solutions
- Examples (worked alone)
 - Based on EIDORS tutorial (with V3.1)

Goal: software community

Project: Electrical
Impedance and
Diffuse
Optical
Tomography
Reconstruction
Software

Blobby the Walrus?

1. EIT images blobby objects in aqueous media; Blobby the Walrus is a fat animal that lives in water.
2. Walrus is EIDORS logo
3. Walruses are much funnier than a talk about software architecture

EIDORS Features

Open-source:

- License: GNU General Public License.
- Free to use, modify, and distribute modifications.
- May be used in a commercial product

Hosted on Sourceforge.net

- Software is available for download (version 2.0)
- CVS access to latest developer versions
- Group members can modify
- Anyone can read and download

Project Goal

to promote a collaboration between groups working on Electrical Impedance Tomography (EIT) and Diffusion based Optical Tomography, in medical and industrial settings; to produce a suite of programs which perform mesh generation reconstruction and display for both techniques. We hope that we can produce robust, reliable and fairly portable software which draws on our collective expertise and implements some of the latest innovations.

Getting Started

To try the EIDORS software, follow these steps:

1. Download the software (release or developer version):
 - *Release Version*: [EIDORS 3.1](#)
 - *Developer Version*: Follow instructions for [Anonymous CVS Access](#)

This Tutorial

Release Version

Developer Version

Features

Language independence:

- Octave (octave.org, ver \geq 2.9)
- Matlab (version \geq 6.0).

Usage examples:

- new software is based on demos.
- simple and more complex usage examples.

Tests:

- Software is intrinsically difficult to test.
- Numerical software is probably more difficult
- Implement of regression test scripts

Features

Pluggable code base:

- Object-oriented: *Packaging* and *Abstraction*.
- Don't use the Matlab OO framework
- Instead, EIDORS designed as "Pluggable" software using function pointers.

Features

Automatic matrix caching:

- Save computationally expensive variables
 - ie Jacobian , Image priors.
- Caching complicates software
- Caching managed in `eidors_obj`

Features

Generalized data formats:

- EIT has a wide variety of stimulation, measurements
- general EIT data format : *fwd_model*
 - electrode positions
 - contact impedances
 - stimulation and measurement patterns.

Interface software for common EIT systems:

- Load data from some EIT systems
- Please contribute

getting started

- Download
 - Run tutorial examples
- Join Mailing list
`eidors3d@listserv.umist.ac.uk`
- Sign up as developer at:
`sourceforge.net`
- Contribute your code

EIDORS Examples

To run these tutorials, you need to download and install EIDORS and then run this command in a matlab (or octave) session.

```
>>run /path/to/eidors3d/startup.m
```
